### Known Bugs or Issues:

*If you have any known bugs or issues with your code, let us know here.*

n/a

---

### Questions:

*In your own words, what is the difference between print and return?*

Return returns the output of a function when called, print prints the input to the console.

*Describe one issue that you encountered while writing and testing your own code. How did you fix it?*

I didn't have any issues.

### Star Point (Optional):

*Leave this section blank if you did not attempt the star point. Was the weight converted back to ounces the same as the original weight in ounces? Explain why or why not.*

I personally used 8 decimal multipliers for both the ounces\_to\_grams and grams\_to\_ounces function, because there is really no efficient way to convert ounces to grams exactly and vice versa, some of the exactitude is lost in either conversion, making it so that there is a difference in the original value and the returned value from the two conversions, even though its very small.
